Présentation

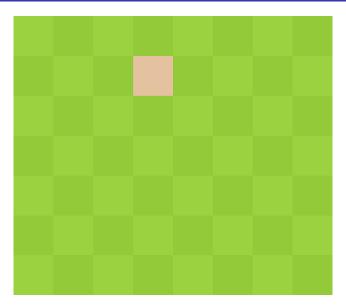

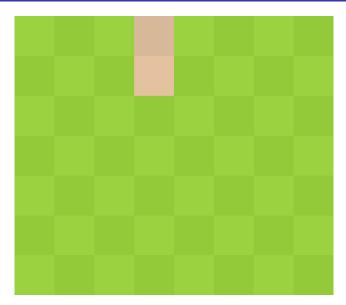

Figure – A gauche le démineur de Google, à droite le Super Démineur

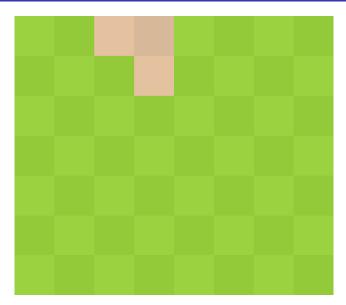

Algorithme de creusage

Algorithme 1 : Creuser

```
Entrées : c_{i,j} la case à creuser de coordonnées (i,j)
1 // Cas de base :
  si ci, i est une bombe ou possède un drapeau alors
         retourner
4 sinon si ci, i a des bombes dans son voisinage de Moore d'ordre 1 alors
         ouvrir(c_{i,i})
         retourner
7 // Cas récursif : C'est une case vide
8 ouvrir(ci.i)
9 // Creuser les cases dans son voisinage de Von Neuman
10 si c<sub>i-1,j</sub> est dans la grille alors
     | Creuser(c_{i-1,i})
12 si c_{i+1,j} est dans la grille alors
13 | \tilde{C}reuser(c_{i+1,i})
14 si ci.i-1 est dans la grille alors
15 | Creuser(c_{i,i-1})
16 si ci.i+1 est dans la grille alors
17 | Creuser(c_{i i+1})
```

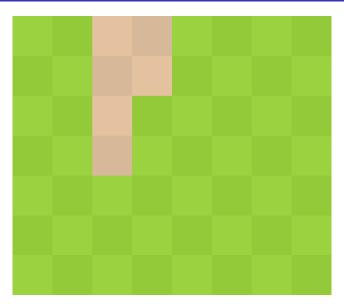

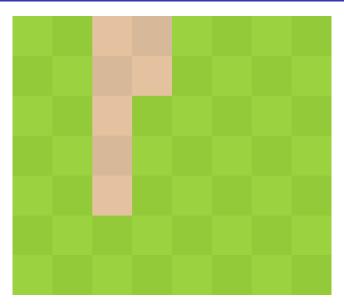

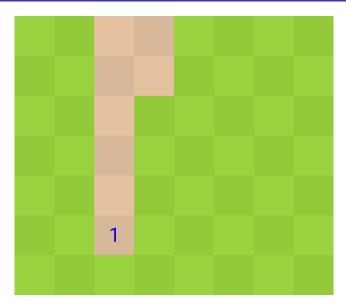

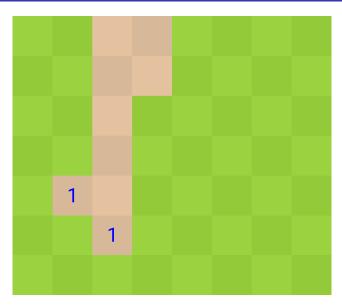

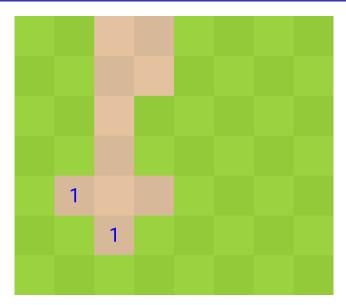

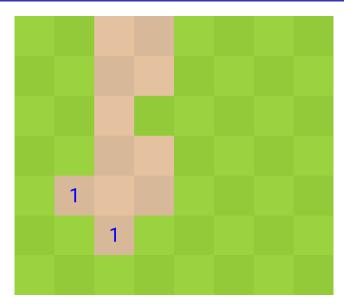

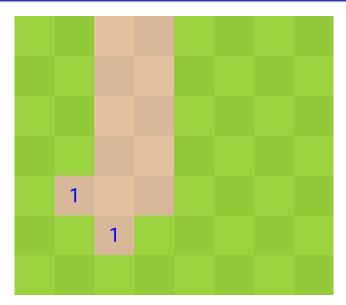

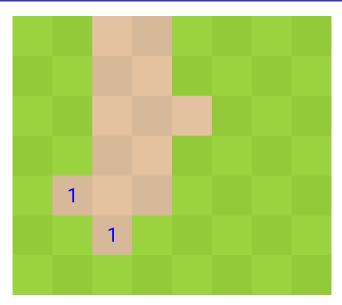

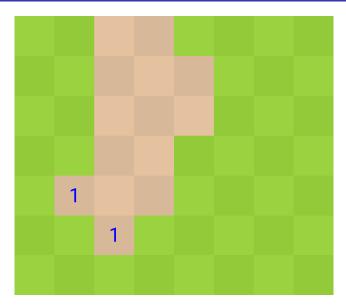

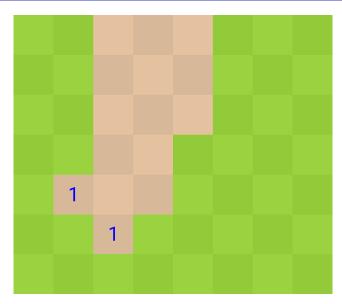

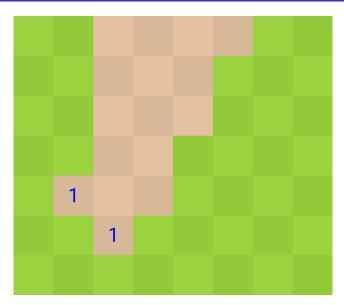

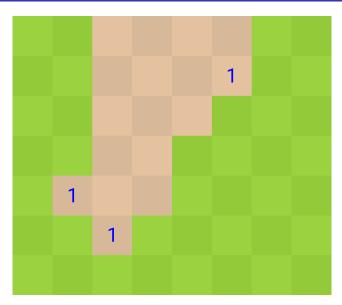

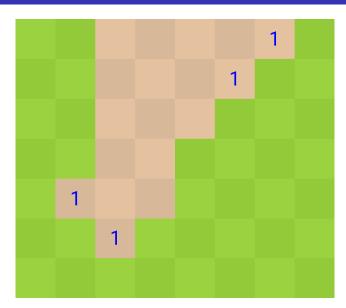

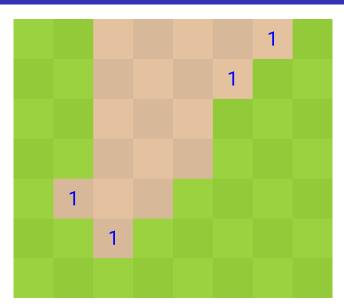

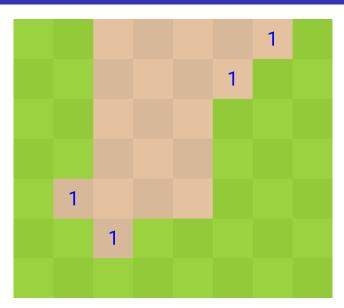

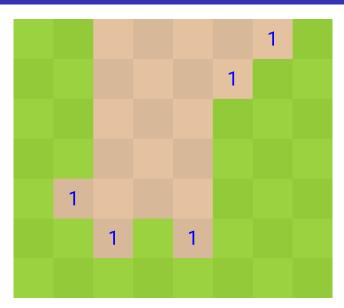

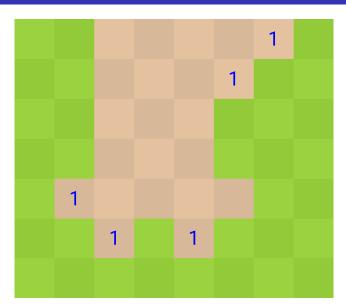

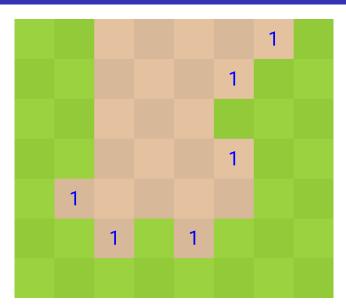

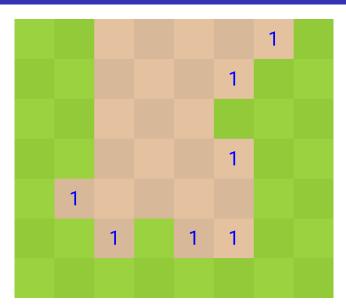

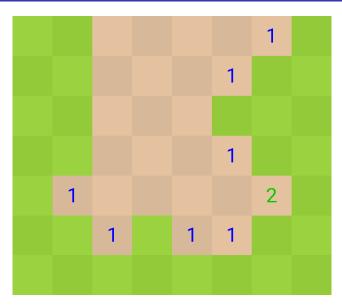

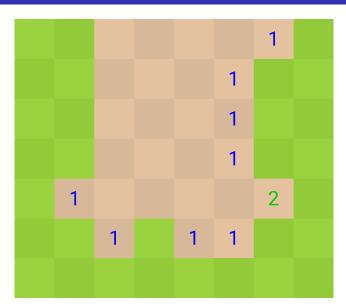

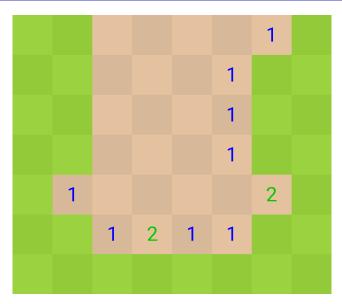

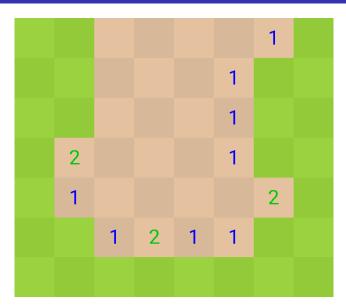

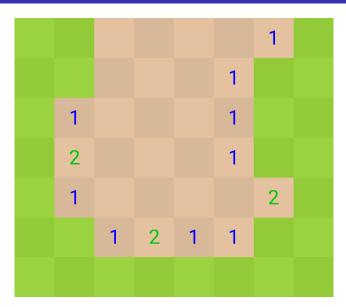

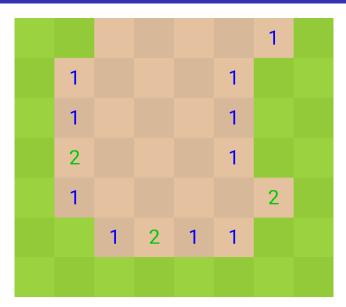

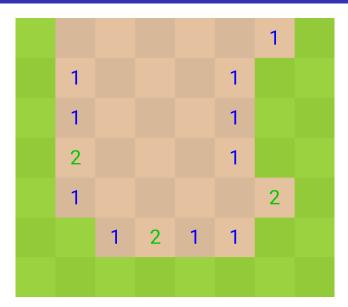

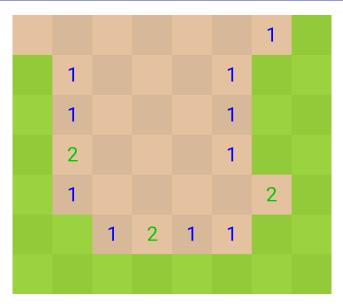

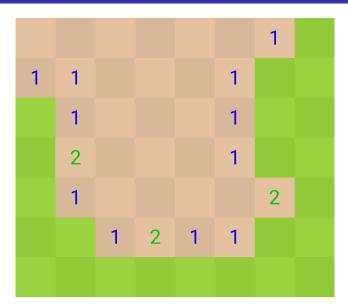

Exemple

Organisation

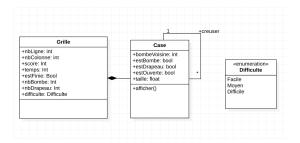

Figure – Diagramme UML initial

- la version Android pour Pierre (https://github.com/smallcluster/Demineur)
- la version iOs pour Olivier (https://github.com/Rprojet/Demineur)

Plan

- Introduction
- Plateau du jeu
 - Vue du jeu
 - Différences iOs/Android
- 3 Conclusion
- 4 Démonstration

Vue du jeu

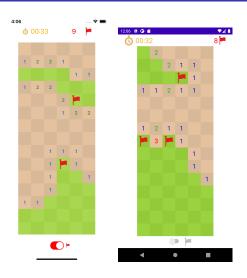

Figure - Vue du jeu : iOs à gauche, Android à droite

Implémentation

Figure - iOs

$$\begin{cases} x = i \times d + \frac{(W - c \times d)}{2} \\ y = j \times d + \frac{(H - i \times d)}{2} \end{cases}$$

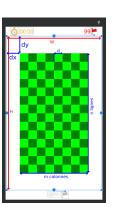

Figure - Android

$$(x,y) = \begin{cases} (dx + j \times d, dy + i \times d) & \text{si mode portrait} \\ (dx + i \times d, dy + j \times d) & \text{si mode paysage} \end{cases}$$

Taille des cases

Figure - iOs

$$d=\frac{(1-m)\times H}{I}$$

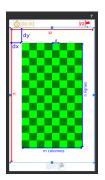

Figure - Android

$$d = \begin{cases} \min\left(\frac{W}{m}, \frac{H}{n}\right) & \text{si mode portrait} \\ \min\left(\frac{W}{n}, \frac{H}{m}\right) & \text{si mode paysage} \end{cases}$$

Entrée du joueur

iOs : Ajout de la callback

→ for:.touchUpInside)

Android : Calcul des coordonnées

Dialogue entre les vues

Figure - Diagramme vue/segue

```
override func prepare(for segue: UIStoryboardSegue,
sender: Any?)
{
    if segue.identifier == "ShowScore"
    {
        let VCDestination = segue.destination as!
        ScoreViewController

        VCDestination.fillDataTabView(scoreList)
    }
}
```

Figure – Diagramme activity/intent

```
public void voirScores(View v) {
    Intent intent=new Intent(this,ScoresActivity.class);
    intent.putStringArrayListExtra("array", stats);
    startActivity(intent);
}
```

Liste de score

Figure - Historique des scores : iOs à gauche, Android à droite

Persistance des données

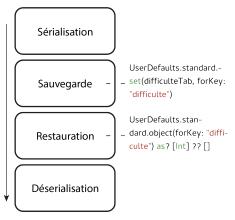

Figure – iOs : Processus persistance

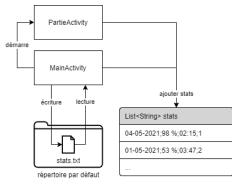

Figure – Android : modification de l'historique

Différences iOs/Android Synthèse

	iOs	Android
Implémentation	UIButton	Canvas
Taille des cases	% hauteur écran	remplissage maximum
Entrée du joueur	Callback	onTouchListener
Dialogue entre les vues	Segue	Intent
Liste de score	UITableView	ExpendableListView
Persistance des données	UserDefaults	text file

Plan

- Introduction
- Plateau du jeu
 - Vue du jeu
 - Différences iOs/Android
- 3 Conclusion
- Démonstration

Conclusion

- communiquer entre membres pour imposer des limites réalistes et garder une interface graphique homogène entre iOs et Android
- découvrir les mécaniques qui régissent le jeu du démineur
- comparer l'implémentation native entre iOs et Android
